Issue #8

### The Increase in Manufacturing Calls For More Flexible Warehouse Space

Manufacturing has seen a big increase in the last couple of years and this means that the need has grown for flexible and convenient warehouse space. In fact, the U.S. Department of Commerce published a report in July of this year stating that U.S. factory orders rose in May including orders for machinery, aircraft, and household appliances.

In addition, the Institute of Supply Management reported that U.S. manufacturing increased the first half of 2013 and is expected to continue to increase through the rest of the year. The increase is leading companies to expand past what they are capable of storing, which can oftentimes put a financial strain on them.

A cost effective solution is a temporary engineered space that can be constructed within a couple of weeks by a professional construction team. Why spend a large amount of money on a permanent shelter for storage space when you can easily have affordable warehouse building that can be relocated when needed?

Shelter Structures understands the importance of adequate space with a price you can afford. This is why we offer structures that can be treated as a temporary warehouse or a permanent solution. Not only are they convenient, but they are also exceptionally sturdy and weather resistant.

For those who outgrow their current space, Shelter Structure can come in and give you an additional, engineered space in a matter of weeks. Because of their simple construction, they can be put up and taken down without a lot of hassle. The buildings can also be customized to meet whatever requirements you may have, as the sizes go all the way up to 100 feet high and 280' wide.

Many industries are taking advantage of these structures, such as factories, construction sites, military bases, water treatment plants, and more. There's no doubt that temporary warehouse buildings will become a necessity for many companies within the next couple of years.
