## Welcome to the Shelter Structures Newsletter: Issue #7

### Hardside: Green and Secure!

Shelter Structures has developed a hybrid shelter that offers the best of all worlds when it comes to portable shelters. Steel panels, or "hardside" provide extra support and security. Fabric roofs continue to offer natural light and economy. And these shelters can also be relocated when a project is completed.

These hardside structures are both portable and eco-friendly. Comprised of rigid galvanized steel and translucent PVC fabric reinforced with polyester, it offers an extra level of security not found in traditional fabric buildings and it's energy-efficient, too. Hardside is part of our green construction design, now more energy-efficient and environmentally friendly than ever!

Sidewalls made of galvanized steel provide strength and rigidity without the necessity of indoor columns. These walls allow hardside shelters to be used in heavy-duty application. A modular design means the sidewalls are easily ready for transport, as well as for future expansion. This ease-of-use saves energy during construction, transport, and installation. The steel walls allow a greater level of security for applications that require additional security. On the other hand, translucent polyester-reinforced PVC membrane covers the roofline, allowing the maximum amount of sunlight to enter and illuminate the inside of the structure, forgoing the need for lighting installation. Along with recycled steel used for the sidewalls, the eco-friendly fabric roof shows our commitment here at Shelter Structures to greener construction. Green design that is built to last, hardside structure is a unique offering from Shelter Structures that is sure to fit your needs, whatever they may be!
